

Dear editors of the Journal of Experimental Biology,

Attached is a manuscript titled “From single to multiple drivers – combined effect of temperature, pH and lithium on the larvae of the sea urchin *Paracentrotus lividus*“, which is being submitted as a research article for possible review and publication in the Journal of Experimental Biology.

The manuscript is not being considered elsewhere and reports a novel approach to better understand the combined effects of multiple drivers on biota.

A full list of authors is included through the submission portal, as well as reviewer suggestions. We suggest Dr. Patricia Schulte as editor for the manuscript, if convenient.

We are submitting the data through the Pangaea service to facilitate integration into the OA-ICC data portal, and are happy to provide the data and code to reviewers or editors upon request.

Thank you for considering our manuscript for review.

Sincerely,

A handwritten signature in black ink, appearing to read 'Einar', with a stylized, cursive script.

Einar Pétur Jónsson
